2 Safety

2.1 Safety Symbols

The following symbols are used in this guide:

⚠ D A N G E R ⚠

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠ W A R N I N G ⚠

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠ C A U T I O N ⚠

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

N O T I C E

Indicates information considered important, but not hazard-related (for example, messages relating to property damage).

2.2 Qualified Personnel

Correct and reliable transport, storage, installation, operation, and maintenance are required for the trouble-free and safe operation of the drive. Only qualified personnel are allowed to install and operate this equipment.

Qualified personnel are defined as trained staff, who are authorized to install, commission, and maintain equipment, systems, and circuits in accordance with pertinent laws and regulations. Also, the qualified personnel must be familiar with the instructions and safety measures described in this manual.

2.3 Safety Precautions

⚠ W A R N I N G ⚠

HAZARDOUS VOLTAGE

AC drives contain hazardous voltage when connected to the AC mains or connected on the DC terminals. Failure to perform installation, start-up, and maintenance by skilled personnel can result in death or serious injury.

- Only skilled personnel must perform installation, start-up, and maintenance.

⚠ W A R N I N G ⚠

UNINTENDED START

When the drive is connected to AC mains, DC supply, or load sharing, the motor may start at any time. Unintended start during programming, service, or repair work can result in death, serious injury, or property damage. Start the motor with an external switch, a fieldbus command, an input reference signal from the local control panel (LCP), via remote operation using MCT 10 software, or after a cleared fault condition.

- Disconnect the drive from the mains.
- Press [Off/Reset] on the LCP before programming parameters.
- Ensure that the drive is fully wired and assembled when it is connected to AC mains, DC supply, or load sharing.

⚠ W A R N I N G ⚠

DISCHARGE TIME

The drive contains DC-link capacitors, which can remain charged even when the drive is not powered. High voltage can be present even when the warning indicator lights are off.

Failure to wait the specified time after power has been removed before performing service or repair work could result in death or serious injury.

- Stop the motor.
- Disconnect AC mains, permanent magnet type motors, and remote DC-link supplies, including battery back-ups, UPS, and DC-link connections to other drives.
- Wait for the capacitors to discharge fully before performing any service or repair work. The discharge time is specified in the operating guide and on the drive nameplate.
- Use a measuring device to make sure that there is no voltage before opening the drive or performing any work on the cables.

⚠ W A R N I N G ⚠

ELECTRICAL SHOCK HAZARD - LEAKAGE CURRENT HAZARD >3.5 MA

Leakage currents exceed 3.5 mA. Failure to connect the drive properly to protective earth (PE) can result in death or serious injury.

- Ensure reinforced protective earthing conductor according to IEC 60364-5-54 cl. 543.7 or according to local safety regulations for high touch current equipment. The reinforced protective earthing of the drive can be done with:
 - a PE conductor with a cross-section of at least 10 mm² (8 AWG) Cu or 16 mm² (6 AWG) Al.
 - an extra PE conductor of the same cross-sectional area as the original PE conductor as specified by IEC 60364-5-54 with a minimum cross-sectional area of 2.5 mm² (14 AWG) (mechanical protected) or 4 mm² (12 AWG) (not mechanical protected).
 - a PE conductor completely enclosed with an enclosure or otherwise protected throughout its length against mechanical damage.
 - a PE conductor part of a multi-conductor power cable with a minimum PE conductor cross-section of 2.5 mm² (14 AWG) (permanently connected or pluggable by an industrial connector. The multi-conductor power cable shall be installed with an appropriate strain relief).
- NOTE: In IEC/EN 60364-5-54 cl. 543.7 and some application standards (for example IEC/EN 60204-1), the limit for requiring reinforced protective earthing conductor is 10 mA leakage current.

⚠ W A R N I N G ⚠

EQUIPMENT HAZARD

Contact with rotating shafts and electrical equipment can result in death or serious injury.

- Ensure that only trained and qualified personnel perform installation, start-up, and maintenance.
- Ensure that electrical work conforms to national and local electrical codes.
- Follow the procedures in this manual.

⚠ C A U T I O N ⚠

INTERNAL FAILURE HAZARD

An internal failure in the drive can result in serious injury when the drive is not properly closed.

- Ensure that all safety covers are in place and securely fastened before applying power.

3 Product Life Cycle Change Status

3.1 Important Customer Information

Danfoss Life Cycle Management Model has been created to provide comprehensive support for our valued customers and to ensure that they have continuous access to lifecycle services. When a product enters in the inactive phase of the lifecycle, the product is no longer in production, and spare parts and service options are no longer available. When a product in the inactive phase reaches the end of useful life, retrofitting to a new drive in the active production is the only option. Danfoss has standardized the life cycle concept for the drive products and service portfolio. The purpose of the life cycle concept is to ensure the best possible return on investment for the customer's installation.

3.2 VLT® 2800 Successor Product VLT® Midi Drive FC 280

After approximately 20 years of production, VLT® 2800 has been discontinued by Danfoss Power Electronics and Drives as it no longer meets the following standards:

EU RoHS 2.0- Restriction of the use of certain Hazardous Substances in electrical and electronic equipment.

Illustration 1: VLT® 2800

The VLT® 2800 has reached the inactive phase of its life cycle and is no longer in active production. The last time to buy date was 2017/4/21, and according to the ISO 9000 approved Danfoss standard No. 501G0366 the service support period ends 2022/4/21.

Illustration 2: VLT® 2800 Life Cycle Phase

Inactive phase: The VLT® 2800 has reached the inactive phase of its lifecycle, which means it is discontinued and no longer in production. Spare parts and service options are no longer available. Operating a drive in this phase may result in unpredictable process downtime due to wear or failure.

Illustration 3: VLT® Midi Drive FC 280

The VLT® Midi Drive FC 280 is more than just a successor. FC 280 is simply the best alternative and offers full backwards compatibility. FC 280 offers several additional functions which make this new drive flexible, communicative, easy to use, and best fit for the application. The drive saves space with its compact enclosure and design for side-by-side mounting and offers a wide range of powerful standard and optional features. For easy commission or service, it connects easily to a PC via USB port.

The VLT® Midi Drive FC 280 is an easy retrofit for the VLT® 2800 using an adapter plate.

Key features:

- Power range:
 - 3x380–480 V: 0.37–22 kW (0.5–30 hp).
 - 3x200–240 V: 0.37–3.7 kW (0.5–5.0 hp).
 - 1x200–240 V: 0.37–2.2 kW (0.5–3.0 hp).
- Current overload 160%/60 s, up to 180%/1 s.

3.3 Advantages and Differences between VLT® 2800 and VLT® Midi Drive FC 280**Illustration 4: VLT® 2800 and VLT® Midi Drive FC 280**

Not all VLT® 2800 can be converted (drives in unusual configurations). Using the *Drive Configurator* tools (in [4.1.2 Conversion Configuration with MyDrive® Assistant](#)) suggests the replacement product that is closest to the drive to be replaced, if not able to make an exact match. For this reason, all the code numbers obtained with the tools must therefore be verified to ensure adequate selection. Contact a Danfoss partner for assistance in this regard.

VLT® Midi Drive FC 280 advantages

- The installation adapter plate is ordered as an external accessory to match the existing mounting holes of the VLT® 2800.
- The LCP display panels are ordered as an external accessory, it is not included as standard by default.
- The IP21/NEMA1 enclosure external accessory cannot be stacked side by side, whereas the IP20 can be stacked side by side.
- The VLT® 2800 accessories are not compatible with FC 280.
- The power options (external power accessories) for the VLT® 2800 are not always compatible and usable in combination with the new VLT® Midi Drive FC 280. Always check compatibility with the help of the VLT® Midi Drive FC 280 Design Guide.
- The single-phase VLT® 2800 with brake chopper cannot be replaced because there is no corresponding VLT® Midi Drive FC 280 with this option (the brake chopper is always present included by default on the 3-phase versions).

6.2 VLT® Numeric Control Panel LCP 21

This panel is an alternative to the graphical display. This simpler and less expensive display does not need adapters to connect to the drive.

Illustration 21: VLT® Numeric Control Panel LCP 21 (Order Code 132B0254)

6.3 Graphic Display Option and LCP adapter for LCP 102

The LCP (Local Control Panel) is not integrated into the drive by default and must therefore be ordered separately.

To connect the LCP 102 Graphical Display to the VLT® Midi Drive FC 280, the following accessories are always needed with LCP 102 Graphical Display:

- Graphical LCP Adapter

The LCP 102 Graphical Display and LCP Adapter must be ordered separately. See [1.3 Additional Resources](#) for the LCP adapter installation instructions for detailed information.

6.4 Memory Module and PROFIBUS Activation Emulator MCM 103

While replacing VLT® 2800 with VLT® Midi Drive FC 280, it is not possible to change the configuration parameters (GSD file) of the drives on the Master (PLC) of the fieldbus.

In this case, it is necessary to use the following option that Danfoss Drives offers for these drives to facilitate the retrofitting of the installed VLT® 2800 drive to VLT® Midi drive FC 280.

MCM 103 is used to activate the emulation function of the VLT® 2800 on the PROFIBUS network.

e30bj205.10

Illustration 24: MCM 103 (Order Code 132B0466)

Principle of operation

The control board transfers data between the drive and the memory module in both directions:

- VLT® Midi Drive FC 280 → MCM 103 to create a full backup of the drive (software and parameters).
- MCM 103 → VLT® Midi Drive FC 280 to activate the PROFIBUS emulation converter of the VLT® 2800 and to restore all data and programming of the drive.

See [1.3 Additional Resources](#) for the memory module installation instructions for detailed information.

6.5 Convert IP20 to IP21/Type 1 Conversion Kit Option

The conversion kit raises the degree of ingress protection (IP21/Type1) for VLT® Midi Drive FC 280.

See [1.3 Additional Resources](#) for the IP21/Type 1 Conversion Kit installation instructions.

7 Mechanical Installation, Wiring, and Cable Connections

7.1 Mechanical Installation

All (IP20) VLT® Midi Drive FC 280 units can be installed side by side in vertical or horizontal position. The units do not require extra ventilation on the lateral side.

Illustration 27: IP20 Enclosure Mounting Side by Side

⚠ CAUTION ⚠

RISK OF OVERHEATING

If the IP21 solution is used, mounting the unit side by side could lead to overheating and unit damage.

- Avoid mounting the unit side by side if IP21 solution is used.

7.2.1 Grounding Principle for EMC-Compliant Installation

There is a risk of interference when there is a ground potential difference between the drive and the control system. Ensure a good electrical contact between the shield cable and the drive enclosure by using metal cable gland or using the clamps provided with the equipment.

- Use high-strand wire to reduce electrical interference.
- Do not use connections as shown in the following illustration A.
- Ground each unit separately as shown in the following illustration B.

For power cables cross-sections, see the VLT® Midi Drive FC 280 Operation Guide.

Design Guide

7.2.3 Connection Tightening Torques

Make sure to use the right torques when tightening all electrical connections.

⚠ CAUTION ⚠

ELECTRICAL CONNECTION ISSUES
Too low or too high torque sometimes causes electrical connection problems.

- To ensure that correct torques are applied, use a torque wrench.
- Recommended slot screwdriver type is SZ5 0.6x3.5 mm.

7.3 Motor Connection

⚠ WARNING ⚠

INDUCED VOLTAGE
Induced voltage from output motor cables that run together can charge equipment capacitors, even with the equipment turned off and locked out/tagged out. Failure to run output motor cables separately or to use shielded cables could result in death or serious injury.

- Run output motor cables separately or use shielded cables.
- Simultaneously lock out/tag out all the drives.

- Comply with local and national electrical codes for cable sizes. For maximum cable sizes, see *chapter Electrical Data* in the VLT® Midi Drive FC 280 Operating Guide.
- Follow motor manufacturer wiring requirements.
- Motor wiring knockouts or access panels are provided at the base of IP21/Type 1 units.
- Do not wire a starting or pole-changing device (for example, Dahlander motor or slip ring induction motor) between the drive and the motor.

7.4.3 Terminal Function Comparison of Control Terminals for VLT® 2800 vs VLT® Midi Drive FC 280

Although the terminals for the control signals are not perfectly identical, the wiring terminal connections on the control board can be used to switch from the VLT® 2800 product to the VLT® Midi Drive FC 280 without having to change or add additional connections.

The power terminal connections for sizes up to 7.5 kW (10 hp) are present, they can be reused without unplugging as they are identical for the 2 series VLT® 2800 and VLT® Midi Drive FC 280. For larger enclosure sizes, the power cables are made directly to the respective terminals on the drive.

7.5 Application Examples and Wiring for VLT® Midi Drive FC 280

The purpose of this chapter is a quick reference for ease of setting up some basic control wiring applications.

For detailed information on application and parameter settings and an example of process PID control, see further instructions in the VLT® Midi Drive FC 280 Operation Guide.

A jumper wire is required between terminal 12 (or 13) and terminal 27 for the drive to operate when using factory default programming values. See the VLT® Midi Drive FC 280 Operation Guide *chapter Enabling Motor Operation (Terminal 27)* for further information.

7.5.1.7 Safe Torque Off (STO)

The Safe Torque Off (STO) function is a component in a safety control system. STO prevents the unit from generating the energy that is required to rotate the motor, thus ensuring safety in emergency situations.

The STO function is designed and approved suitable for the requirements of:

- IEC/EN 61508: SIL2
- IEC/EN 61800-5-2: SIL2
- IEC/EN 62061: SILCL of SIL2
- EN ISO 13849-1: Category 3 PL d

To achieve the required level of operational safety, select and apply the components in the safety control system appropriately. Before using STO, carry out a thorough risk analysis on the installation to determine whether the STO function and safety levels are appropriate and sufficient.

For more information on safe torque off (STO), see *chapter Safe Torque Off (STO)* in the VLT® Midi Drive FC 280 Operating Guide.

7.6 Fuses and Circuit Breakers

7.6.1 Introduction

Use fuses and/or circuit breakers on the supply side to protect service personnel and equipment from injuries and damage if there is component breakdown inside the drive (first fault).

Branch circuit protection

Protect all branch circuits in an installation, switchgear, and machines against short circuit and overcurrent according to national/international regulations.

N O T I C E

Integral solid-state short-circuit protection does not provide branch circuit protection. Provide branch circuit protection in accordance with the national and local rules and regulations.

⚠ W A R N I N G ⚠

PERSONAL INJURY AND EQUIPMENT DAMAGE RISK

Malfunction or failing to follow the recommendations may result in personal risk and damage to the drive and other equipment.

- Select fuses according to recommendations. Possible damages can be limited to be inside the drive.

7.6.2 Recommendation of Fuses

N O T I C E

EQUIPMENT DAMAGE

Failure to follow the protection recommendations can result in damage to the drive.

- Using fuses and/or circuit breakers is mandatory to ensure compliance with IEC 60364 for CE.

Danfoss recommends using the fuses and circuit breakers in the following tables to ensure compliance with UL 508C or IEC 61800-5-1. For non-UL applications, design circuit breakers for protection in a circuit capable of delivering a maximum of 50000 A_{rms} (symmetrical), 240 V/400 V maximum. The drive short-circuit current rating (SCCR) is suitable for use on a circuit capable of delivering not more than 100000 A_{rms}, 240 V/480 V maximum when protected by Class T fuses.

The following tables list the recommended fuses that have been tested.

9 Integration with the Existing PROFIBUS Communication

9.1 PROFIBUS Fieldbus

PROFIBUS is a fieldbus system, which can be used for linking automation devices such as sensors and actuators with the controls by means of a 2-conductor cable. PROFIBUS DP is a fast communication protocol, made specially for communication between the automation system and various types of equipment. PROFIBUS is a registered trademark.

The FC Profile protocol available as communication interface in both VLT® 2800 and FC 280 products is not compatible with each other. The products must be reprogrammed and adapted to the new protocol or PROFIdrive profile.

It is necessary to include the MCM 103 memory module. The master detects the new FC 280 automatically as if it was a VLT® 2800, without changing the GSD file.

- The VLT® Memory Module MCM 103 must be ordered as a separate component and is not included in an FC 280 delivery.
- The converter only converts the current value. It does not convert the default values and parameter attributes. The parameters in the list are not set to the VLT 2800 default value automatically, when the drive is initialized.
- For other settings such as node address/baud rate, see [1.3 Additional Resources](#) VLT® Midi Drive FC 280 PROFIBUS DP Programming Guide for more information.
- The FC 280 converter is based on VLT 2800 standard software version 3.23.
- The VLT® Midi Drive FC 280 firmware must be version 1.50 or higher, for the memory module functions to work.
- There is no need to change PLC or upload GSD files.

NOTICE

The PROFIBUS connector on the VLT® Midi Drive FC280 is located on the top of the drive, while the PROFIBUS connection on the VLT®2800 is located on terminals 68/69 at the bottom of the drive.

Illustration 55: FC 280 and MCM 103 Memory Module

Insert the MCM 103 Memory Module into its slot. VLT® Memory Module MCM 103 Installation Instructions, see [1.3 Additional Resources](#).

9.2 Integration with Existing PROFIBUS Fieldbus

NOTICE

The parameters of the PROFIBUS interface and communication are not automatically converted by the MCT 10 software setup tool.

- Therefore, the node number, the command reference source, and the emulation enablement of the VLT® 2800 on the fieldbus must be set manually and verified.

For some specific usages of the VLT® 2800 through a fieldbus option, it may be necessary to consider employment of a 24 V backup option (132B0368) when configuring the new drive, since the boot time between the 2 drive series is different.

A list of parameters to set and verify are described in [Table 24](#):

11.2 Installation Checklist

Before completing installation of the unit, inspect the entire installation as detailed in [Table 30](#). Check and mark the items when completed. Before commissioning or start-up, refer to the operating guide and Safety chapter.

⚠ CAUTION ⚠

POTENTIAL HAZARD IN THE EVENT OF INTERNAL FAILURE.

Risk of personal injury if the drive is not properly closed.

- Before applying power ensure that all safety covers are in place and securely fastened.

Inspect for	Description	☑
Auxiliary equipment	<ul style="list-style-type: none"> • Look for auxiliary equipment, switches, disconnects, or input fuses/circuit breakers located on input power side of the drive, or output side to the motor. Examine their operational readiness and ensure that they are ready in all respects for operation at full speed. • Check function and installation of any sensors used for feedback to the drive. • Remove power factor correction caps on motor(s), if present. 	
Cable routing	<ul style="list-style-type: none"> • Adjust any power factor correction capacitors on the mains side and ensure that they are dampened. • Ensure that input power, motor wiring, and control wiring are separated or in 3 separate metallic conduits for high-frequency noise isolation. 	
Control wiring	<ul style="list-style-type: none"> • Check for broken or damaged wires and loose connections. • Check that the control wiring is isolated from power and motor wiring for noise immunity. • Check the voltage source of the signals, if necessary. • The use of shielded cable or twisted pair is recommended. Ensure that the shield is terminated correctly at both ends. 	
Cooling clearance	<ul style="list-style-type: none"> • Units require top and bottom clearance adequate to ensure proper airflow for cooling. 	
Ambient conditions	<ul style="list-style-type: none"> • Check that requirements for ambient conditions are met. 	
Fusing and circuit breakers	<ul style="list-style-type: none"> • Check for proper fusing or circuit breakers. • Check that all fuses are inserted firmly and are in operational condition, and that all circuit breakers are in the open position. 	
Grounding	<ul style="list-style-type: none"> • Check for sufficient ground connections and ensure that they are tight and free of oxidation. • Do not ground to conduit or mount the back panel to a metal surface. 	
Input and output power wiring	<ul style="list-style-type: none"> • Check for loose connections • Check that the motor and mains cables are in separate conduit or separated shielded cables 	
Switches	<ul style="list-style-type: none"> • Ensure that all switch and disconnect settings are in the proper position. 	

Inspect for	Description	☑
Panel interior	<ul style="list-style-type: none"> • Inspect that the unit interior is free of dirt, metal chips, moisture, and corrosion. • Check that the unit is mounted on an unpainted, metal surface. 	
Switches	<ul style="list-style-type: none"> • Ensure that all switch and disconnect settings are in the proper positions. 	
Vibration	<ul style="list-style-type: none"> • Check that the unit is mounted solidly or that shock mounts are used, as necessary. • Check for an unusual amount of vibration.
